

ABTalks Redesign

Complete prompt log for the hackathon submission project

1

Prompt 1 – Initial redesign brief

<https://www.abtalks.in/hackathon/submission>

Rebuild this website, featuring the suggested updates mentioned in the 1st problem statement on this website. The statement is: "Redesign ABTalks (Reimagine the platform you are standing on)."

Kicked off the project: fetch the live ABTalks site and redesign it against the hackathon's own "redesign ABTalks" problem statement.

2

Prompt 2 – Three-screen spec

Now, this website should have three screens:

1. Landing page - the first experience for a student who has never heard of ABTalks. Show enough trust, clarity, and motivation that they are willing to commit to a 60-day challenge.
2. Student Dashboard - the home screen after logging in. Include essentials such as:
 - a. Current streak
 - b. Today's task
 - c. Progress through the challenge
 - d. Overall completion
 - e. Student standing or achievements
3. Challenge day - The complete experience of a single challenge day. Student should be able to:
 - a. Read the day's task
 - b. Understand what needs to be built
 - c. Submit proof of work:
 - i. GitHub repository or commit
 - ii. LinkedIn post

What We're Looking For

Your redesign should:

Be designed mobile-first (390px), with desktop as a secondary consideration.

Be understandable to a student who has never heard of ABTalks.

Handle real-world edge cases such as:

First day with no streak

A missed day

An empty profile

Introduce at least one thoughtful idea that improves the student experience.

Out of Scope

You do not need to build:

Authentication

Real user accounts

A production database

Use mocked data instead.

A simple JSON file (written by you or generated using AI) is sufficient as long as the interface feels realistic.

Also out of scope:

Recruiter dashboard

Admin panel

Matching ABTalks' current tech stack

Defined the full three-screen scope (landing, dashboard, challenge day), the required edge cases, the mobile-first constraint, and what was explicitly out of scope.

3 Prompt 3 – Request for code

Give me the HTML code.

Asked for the raw source of the three-screen mock app.

4 Prompt 4 – Request for code (repeat)

Give me the code which you have used to make this.

Asked again for the underlying source code.

5 Prompt 5 – “Make it feel real” enhancement brief

Make the App "Feel" Real (Functionality)

* Add LocalStorage Persistence: Right now, if a judge submits a task and refreshes the page, the state resets. Add a few lines of JavaScript to save the `PERSONAS` object to the browser's `localStorage`. When the page loads, check if `localStorage` has data and use that. This makes your mock app feel

like a fully deployed, production-ready product.

- * Simulate Authentication: The persona switcher is brilliant for judging. To make it even better, add a "Sign in with GitHub" or "Sign in with Discord" button on the landing page that, when clicked, automatically logs the user in as the "brand new student" persona.

- * Add a Confetti Animation on Submission: When the user clicks "Submit today's proof," it currently just changes the screen. Hackathons are all about the user experience. Adding a lightweight confetti script (like ``canvas-confetti``) when they submit a task gives a massive dopamine hit and will definitely make the judges smile.

2. Tie It Back to the ABTalks Brand

- * Integrate the Original Socials: The original website footer emphasizes the ABTalks community with links to their Discord, Instagram, LinkedIn, and YouTube. You should add a "Community" tab or integrate these links into your user dashboard.

- * Promote the Discord Review System: Your text mentions, "Every task is reviewed by real students in Discord." Add a floating "Join Discord" button or an explicit CTA on the submitted task page where students can "Ask for review in Discord," linking directly to the ABTalks server.

3. Polish the UI/UX

- * Screen Transitions: Currently, you swap screens by toggling the ``hidden`` class, which makes them snap instantly. You can add a simple CSS fade or slide-in animation.

CSS

...

```
.screen { animation: fadeIn 0.3s ease-in-out; }  
@keyframes fadeIn { from { opacity: 0; transform: translateY(10px); } to { opacity: 1; transform: translateY(0); } }
```

...

- * Responsive Desktop Layout: You've built a brilliant mobile-first app constrained to a 428px phone frame. While this is great for a mobile web app, judges often view projects on large monitors. Consider adding a CSS ``@media`` query that un-constrains the frame on desktops and turns the bottom nav into a persistent left-hand sidebar for a true "desktop dashboard" feel.

- * A "Leaderboard" Screen: Gamification is huge. You already track "Standing" (e.g., Top 12% this week). Adding a third navigation button at the bottom for a "Leaderboard" that shows mocked rankings of other students would make the 60-day challenge feel incredibly active and competitive.

Requested three groups of upgrades: functionality (persistence, simulated auth, confetti), brand ties to ABTalks' real Discord/social presence, and UI polish (transitions, a desktop sidebar layout, and a leaderboard screen).

Give me the raw HTML code for the above.

Asked for the raw source of the updated app after the enhancement pass.
